

REMARKS

Reconsideration of this application is respectfully requested in view of the foregoing amendment and the following remarks.

At the outset, the Examiner is thanked for the review and consideration of the present application. Claims 1-6 are currently pending in this application. Claims 1, 5 and 6 have been amended. The basis for the amendments can be found throughout the specification, drawings and claims of the original application, and no new matter is entered.

In the Office Action, claims 1-6 were rejected under 35 U.S.C. 112, first paragraph and Claim 6 was rejected under 35 U.S.C. 103(a) as being unpatentable over Shimada. To the extent these rejections might still be applied to claims presently pending in this application, they are respectfully traversed.

The Examiner is respectfully requested to reconsider and withdraw the rejection(s) in view of the Amendments and remarks contained herein.

35 U.S.C. §112 Rejections

Claims 1-6 were rejected under 35 U.S.C. §112 as failing to comply with the enablement requirement. The Applicants respectfully acknowledge the Examiner's comments in this regard. The term "a target driver circuit" in Claims 1, 5 and 6 means one of all driving circuits, which is currently selected for testing, and has been amended as "one of the driver circuits" for clarity. Support for these amendments can be found at least at paragraphs [0017] and [0025] of the specification. Therefore, the Applicants, now, even more clearly point out and distinctly claim

the subject matter of the invention. In view of the foregoing, withdrawal of the rejection under 35 U.S.C. §112 is respectfully urged.

35 U.S.C. §103 Rejections

The Examiner rejected Claim 6 under 35 U.S.C. 103(a) as being unpatentable over Shimada (U.S. 5,740,272). The Applicant respectfully traverses the rejection at least in view of the reasons provided below.

Shimada discloses an apparatus comprising an image pickup means (15) for picking up an infrared image, an image processing means (16) for processing image, a signal feeding means (17) for feeding signal to each wire and a control means (18). However, regarding Claim 6, the present invention provides a pixel selection device, a signal extractor, and a signal analyzer, wherein the pixel selection device is configured to select one of the driver circuits and the signal extractor is configured to retrieve a signal. In column 9, lines 32-41 of Shimada, the signal feeding means (17) is used to feed signal into a wirings, but the pixel selection device of the present invention is used to select a driver circuit for test. Moreover, in column 9, lines 42-47 of Shimada, the image pickup means (15) is used to pick up an infrared image of the substrate as an infrared camera, but the signal extractor of the present invention is used to retrieve a current signal or a voltage signal. Besides, testing driver circuits of an AMOLED prior to the implantation of OLED is another feature of the present invention, which can reduce the production cost of failing OLED. Yet, none of this is disclosed by Shimada. In other words, the apparatus of Shimada cannot produce the features and effects of the claimed invention.

Serial No.: 10/822,750
